Device Description
1 Device Description

1.1 Security Advice

- The device may only be used for its intended purpose.
- The device must be mounted in a housing / control cabinet in the end application and must not be accessible during operation.
- The supply circuit requires an all-pole disconnecting device. The disconnecting device must at least meet the requirements of DIN VDE 100.
- Never work when voltage is applied.
- The device may only be installed and used by qualified personnel. The manufacturer accepts no liability for damage or injury caused by improper use of the device.
- It is not possible for the customer to repair the device. Repairs may only be carried out by the manufacturer.
- Connect the device to the mains or to a suitable low-voltage source. Under no circumstances may the device be supplied with power from the mains and the low-voltage source at the same time! (For details see technical data).
- The device may only be operated on the supply mains on a circuit with a fuse protection of max. 16 A.
- The power cables and plugs used must be in perfect condition.
- The device is only intended for use in dry and clean environments.
- The thermal specifications must be observed.
- Please also observe the safety instructions and operating instructions of the other devices that are connected to the device.
- The device is not a toy. It must not be stored or operated within the reach of children.
- Do not leave packaging material lying around carelessly. Plastic sheets/bags, Styrofoam parts, etc. could become a dangerous toy for children. Please recycle the packaging material.
- If you are not clear about the correct connection or if any questions arise that are not clarified by the operating instructions, please contact our support.

1.2 Content of Delivery

The package includes:

- Expert Net Control 2302
- Quick Start Guide

1.3 Description

The Expert Net Control 2302 can switch 4 different relay outputs and monitor 8 passive signal inputs. The device has the following features:

- 4 switchable, potential-free relay outputs (see technical data)
- Relays dispose of high contact reliability also at very small loads
- 8 passive inputs for monitoring NO and NC devices, e.g. door contacts, smoke detectors etc.
Device Description

- Stop input to switch-off of all relays
- Operation with AC or DC voltage (see technical data)
- Optional sensor for environmental monitoring (temperature, humidity and air pressure)
- Console commands via SSH, Telnet and serial interface
- SSH support with public key and passwords
- Individually parameterisable switch-on delay of all outputs
- Programmable timetables and turn-on/turn-off sequences
- Individually adjustable watchdog for each output, which switches depending on accessibility (network ping)
- Dual TCP/IP stack with IPv4 and IPv6 support (IPv6-ready)
- Control and monitoring of the device via Ethernet with an integrated web server with SSL encryption (TLS 1.1, 1.2, 1.3)
- Control and configuration with CGI parameters and JSON messages via HTTP (REST API)
- SNMP (v1, v2c and v3, traps)
- MQTT 3.1.1 Support
- Modbus TCP support
- Radius support
- Generation of messages (e-mail, syslog and SNMP traps) and switching of relays depending on sensor measurement limits
- Firmware update during operation via Ethernet possible
- Encrypted e-mails (SSL, STARTTLS)
- Access protection through IP access control
- Low own consumption
- Developed and produced in Germany
1.4 Installation

1. AC power supply
2. Four relay outputs (potential-free)
3. Ethernet connector (RJ45)
4. Sensor connector (RJ45)
5. Activity LED (Input) for digital inputs
6. 4 status LED for relay outputs
7. Status LED
8. Button for Select and OK
9. Alternative low power supply LV PWR (Low Voltage PoWeR)
10. Eight passive inputs (with GND) for 2 inputs each
11. Stop input (with GND) to switch-off of all relais

Start-up the device

- Connect the device to the mains or to a low-voltage source (see technical data). Under no circumstances may the device be supplied with the mains and plug-in power supply at the same time!
- Plug the network cable into the Ethernet socket (RJ45).
- Connect the relay to the loads that should be operated.
- Make contact between the lines to be monitored and the digital inputs. To close an input circuit there has to be a connection between a ground pin and the respective input pin has to be made.
• Connect the sensor (if any) to the device.

1.4.1 Connection Example

Here an example of a block diagram in which the device is supplied with 230V AC, and four AC loads (L1 - L4) are connected. In addition, the inputs are joined to eight switches (S1 - S8), and the stop input is connected to the push-button PB1.

As an alternative to connecting "In 1-8" and "GND", voltages can also be fed in between "In 1-8" and GND. The maximum input voltage is 24V, voltages below 3V are detected as LOW state, and voltages above 8V are detected as HI.
### 1.5 Technical Specifications

| Connections | 1 x Ethernet connection RJ45  
|            | 1 x RJ45 for external sensor  
|            | 1 x mains connection AC, AK700  
|            | 1 x low voltage DC, AK700  
|            | 8 x inputs I1 ... I8, AK700  
|            | 1 x stop input, AK700  
|            | 4 x relay switching contacts NO, AK700  
| Network connection | 10baseT / 100baseTX Ethernet  
| Relay outputs | L1 ... L4 max. 240V AC 16A, 50/60Hz  
|              | 24V DC 10A  
| Inputs I1 ... I8 Stop | screw terminal, AK700 /..-5.0-V-GREEN  
|            | digital input, internal pull-up  
|            | active: max. 24V, 3V LOW, 8V HI  
|            | passive: switching contact  
| Power supply | internal power supply:  
|              | 100V to 240V AC -15% ...+10%, 50/60 Hz, max 0.25A  
|              | Low voltage:  
|              | 12V to 24V AC -10% ...+10%, 50/60Hz, max 0.6A  
|              | 12V to 30V DC -5% ...+5%, max 0.6A  
|              | internal fuse protection: I2t(A2s) = 1.5  
| Protection class | Class II  
| Environment | Ambient temperature  
|              | 0°C to 50°C  
|              | Storage temperature  
|              | -20°C - 70°C  
|              | Humidity  
|              | 0% - 95% (non-condensing)  
| Housing | Black plastic  
| Dimensions | 105mm x 70mm x 90mm (L x H x D)  
| Weight | approx. 300g  

⚠️ Under no circumstances may the device be supplied with power from the mains and the low-voltage source at the same time!

| Connection technology | Screw terminal  
|-----------------------|----------------  
| Solid conductor | 0.2 ... 4.0 mm²  
| Fine-stranded conductor (flexible) | 0.2 ... 2.5 mm² Fine-stranded conductor  
| Fine stranded conductor, wire end ferrule | 0.25 ... 5 mm²  
| Stripping length | 8.0 mm  

### 1.6 Sensor

One external sensor can be connected to the **Expert Net Control 2302**. The following sensors are currently available
### Device Description

</tbody>
</table>

A click on the link in the "Name" column opens the display of the Min and Max values. The values in a column can be reset using the "Reset" button. The "Reset" button in the name column deletes all stored Min and Max values.
Operating
2 Operating

2.1 Operating the device directly

Port Switching

The current switching state of the output is indicated by the corresponding plain text displays (port LEDs). If the green "on" LED is lit, the port is switched on, if the red "off" LED is lit, the output port is switched off. The buttons "Select" and "Ok" are located on the device. If you press "select", you can select the following modes one after the other (in the front panel configuration you can deactivate the modes "All on" or "All off").

1. All on (PALL in the display): All LEDs flash green. If you press the "Ok" button for 2.5 seconds, all ports are switched on.
2. All off (PALL in the display): All LEDs flash red. If you hold the "Ok" button for 2.5 seconds, all ports are switched off.
3. If you press "Select" again, the LED for the first output starts flashing, i.e. the output is selected. Press "Select" again to select the next output. Pressing and holding the "Ok" button for one second will toggle the state of the selected output.

⚠️ If the ports are already "All on" or "All off", the corresponding mode is skipped.

Status-LED

The Status LED shows the different states of the device:

- red: The device is not connected to the Ethernet.
- orange: The device is connected to the Ethernet and waits for data from the DHCP server.
• green: The device is connected to the Ethernet and the TCP/IP settings are allocated.
• periodic blinking: The device is in Bootloader mode.

2.2 Control Panel

Access the web interface: http://"IP-address" and log-in.

The web page provides an overview of the switching state, as well as the external sensor, provided that it is connected. When a single port is clicked at the Expert Net Control 2302, a panel with buttons to control a single port appear:

The Port icon is green when the relay is closed, or red in the open state. An additional small clock icon indicates that a timer is active. Timer can be activated by delay, reset or batch mode.
An activated Watchdog is represented by an eye icon. An "X" means, that the address that should be observed, could not be resolved. Two circular arrows show a booting status.

The ports can be switched manually with the "On" and "Off" buttons. If the port is turned on, it can be turned off by pressing the "Reset" button, until after a delay it turns itself on again. The delay time is determined by the parameter Reset Duration, which is described in the chapter "Configuration - Output Ports". The "Close" button dissolves the panel again.

**Batchmode**

Each individual port can be set for a selectable period of time to the state "switch on" or "switch off". After the selected time they are automatically switched to the second preselected state.

Optionally the device can be switched via a Perl script or external tools like wget. More information is available on our support wiki at www.gude.info/wiki.

The website contains a status overview of all passive signal inputs, the time since the last change, and a counter of switching changes. The name and text for a logical state of each input can be configured in the chapter Configuration-Input Ports.

### 2.3 Maintenance

The actual device generation with IPv6 and SSL allows all maintenance functions in the web interface to be carried out on the Maintenance Page.
Operating

Maintenance in the web interface

The following functions are available from the maintenance web page:

- Firmware Update
- Change the SSL certificate
- Load and save the configuration
- Restart the device
- Factory Reset
- Jump into the Bootloader
- Delete the DNS cache

Upload Firmware, Certificate or Configuration

On the Maintenance Page, select the required file with "Browse .." in the sections "Firmware Update", "SSL Certificate Upload" or "Config Import File Upload" and press "Upload". The file is now transferred to the update area of the device and the contents are checked. Only now, pressing the "Apply" button will permanently update the data, or abort with "Cancel".

⚠️ Only one upload function can be initiated with a reboot, eg. you cannot transmit firmware and configuration at the same time.

⚠️ If after a firmware update, the web page is not displayed correctly anymore, this may be related to the interaction of Javascript with an outdated browser cache. If a Ctrl-F5 does not help, it is recommended that you manually delete the cache in the browser options. Alternatively, you can test start the browser in "private mode".

⚠️ During a firmware update, old data formats are sometimes converted to new structures. If an older firmware is newly installed, the configuration data and the energy meters may be lost! If the device then does not run correctly, please restore the factory settings (e.g. from the Maintenance Page).

Actions in Bootloader mode

If the web interface of the device is no longer accessible, the device can be put into Bootloader mode (see chapter Bootloader activation). The following functions can be executed using the GBL_Conf.exe application:

- Set IPv4 address, net-mask and gateway
- Turn HTTP password on and off
- Turn IP-ACL on and off
- Factory Reset
- Allow jump from firmware to bootloader
- Restart the device

⚠️ For devices with relays, entering or exiting the bootloader mode does not change the state of the relays as long as the operating voltage is maintained.

The GBL_Conf.exe program is available free of charge on our website www.gude.info and can also be found on the enclosed CD-ROM.
To check the network settings with GBL_Conf.exe, start the program and choose "All Devices" in the "Search" menu. From the list select the appropriate device. The lower part of the left half of the window now shows the current network settings of the device. If the IP address is displayed with the default settings (192.168.0.2), either no DHCP server is present on the network, or there could be no free IP address assigned to it.

- Activate the Bootloader Mode (see Chapter Bootloader Mode) and choose in menu "Search" the item "Bootloader-Mode Devices only"
- Enter the desired settings in the edit window and save them with "Save Config".
- Deactivate the boot loader mode for the changes to take effect. Select again "All Devices" in the "Search" menu of GBL_Conf.exe.

The new network configuration is now displayed.

⚠ Changing the configuration with gbl_conf.exe is explicitly only allowed in bootloader mode!

Factory Reset

The device can be reset to the factory default via the web interface from the Maintenance Page[^10] or from the Bootloader mode (see chapter Bootloader activation[^11]). All TCP/IP settings are reset in this operation.

⚠ If a unit is set to factory defaults, an uploaded certificate or updated firmware will be preserved.
2.3.1 Maintenance Page

This section provides access to important functions such as Firmware Update or Restart Device. It is advisable to set an HTTP password for this reason.

**Firmware Update**: Start a firmware update.

**SSL Certificate Upload**: Saves your own SSL certificate. See chapter “SSL” for the generation of a certificate in the right format.

**Config Import File Upload**: Loads a new configuration from a text file. To apply the new configuration, a "Restart Device" must be executed after the "Upload".

**Config File Export**: Saves the current configuration in a text file.

![Image](image.png)

- Saving the configuration should only be carried out in an SSL connection, since it contains sensitive password information (even if it is encrypted or hashed).

- **Restart Device**: Restarts the device without changing the status of the relays.

- Some functions such as a firmware update or changing of the IP-address and HTTP settings require a restart of the device. A jump to the boot loader or a restart of the device lead by no means to a change of the relay states.

- **Restore Fab Settings and Restart Device**: Performs a restart and resets the device to factory default.
Enter Bootloader Mode: Jumps into bootloader mode, where additional settings can be made with GBL_Conf.exe.

Flush DNS Cache: All entries in the DNS cache are discarded and address resolutions are requested again.

Config/Status View: status.html: Displays the status.html page with the JSON data.

Config/Status Download: export.json: Direct file download of JSON data from status.html.

2.3.2 Configuration Management

The device configuration can be saved and restored in the maintenance area.

The "Config File Export" function can be used to save the current configuration as a text file. The syntax used in the configuration file corresponds to the commands of the Telnet console. If the configuration of a device is to be restored from a text file, load the file with "Upload" and restart the device with "Restart Device".

⚠️ Saving the configuration should only be carried out in an SSL connection, since it contains sensitive password information (even if it is encrypted or hashed). For the same reasons, it is advisable to carefully handle the generated configuration files when archiving.

Editing the configuration file

It is possible to customize a saved configuration file with a text editor for your own needs. For example, one scenario would be to use a script language to automate the creation of many customized versions of a configuration, then equip a large number of devices with an individualized configuration. Also Upload and restart with CGI commands can be done in scripting languages. With use of the comment sign "#" you can quickly hide single commands or add personal notes.

If you modify a configuration file manually, it is not always clear which limits are allowed for parameters. After uploading and restarting, commands with invalid parameters are ignored. Therefore, the generated configuration includes comments describing the boundaries of the parameters. Where "range:" refers to a numeric value, and "len:" to a text parameter. E.g:

```
email auth set 0 #range: 0..2
email user set "" #len: 0..100
```

The command "system fabsettings" from the beginning of a generated configuration file brings the device into the factory state, and then executes the individual commands that
modify the configuration state. It may be desirable to make the changes relative to the current configuration, and not out of the factory state. Then the "system fabsettings" should be removed.

No output of default values

The configuration file contains (with exceptions) only values which differ from the default. The command "system fabsettings" (go to the factory state) from the beginning of a generated configuration file should not be removed, otherwise the device can get incompletely configured.

Configuration via Telnet

The configuration files can in principle also be transferred in a Telnet session, but then the settings are changed during operation, and not completely when restarting, as it would have been the case with an upload. It can happen that events are triggered at the same time as the device is configured. One should therefore:

a) disable the function
b) completely parametrize
c) reactivate the function

An example:

```
email enabled set 0
email sender set "" #len: 0..100
email recipient set "" #len: 0..100
email server set "" #len: 0..100
email port set 25
email security set 0 #range: 0..2
email auth set 0 #range: 0..2
email user set "" #len: 0..100
email passwd hash set "" #len: 0..100
email enabled set 1 #range: 0..1
```

2.3.3 Bootloader Activation

The configuration of the device from the application "GBL_Conf.exe" is only possible, if the device is in Bootloader Mode.

Activation of the Bootloader Mode

1) via push button:
   - Hold both buttons for 3 seconds

2) or
   - Remove the power supply
   - Hold down the "Select" button. If the push button is recessed, use a pin or paper clip
   - Connect the operating voltage
Operating

3) by Software:

- Start the "GBL_Conf.exe" program
- Do a network search with the "Search" menu action
- Activate in menu "Program Device" the item "Enter Bootloader"

🚨 This function is only possible if "Enable FW to BL" was activated in the application "GBL_Conf.exe" before, while the device was already in the bootloader.

4) via web interface:

Press "Enter Bootloader Mode" on the maintenance web page.

Whether the device is in Bootloader mode, is indicated by the flashing of the status LED, or it is shown in "GBL_Conf.exe" application after a renewed device search (appendix "BOOT-LDR" after the device name). In Bootloader mode the program "GBL_Conf.exe" can disable the password and the IP ACL, perform a firmware update, and restore the factory settings.

🚨 For devices with relays, entering or exiting the bootloader mode does not change the state of the relays as long as the operating voltage is maintained.

Abandonment of the Bootloader Mode

1) via push button:

- Hold both buttons for 3 seconds (only if the device has 2 buttons)

2) or

- Remove and connect the power supply without operating a button

3) by Software:

- Start the "GBL_Conf.exe" application
- Do a network search with the "Search" menu action
- In menu "Program Device" activate the item "Enter Firmware"

🚨 For devices with relays, entering or exiting the bootloader mode does not change the state of the relays as long as the operating voltage is maintained.

Factory Reset

If the device is in bootloader mode, it can always be put back to its factory default. All TCP/IP settings are reset in this operation.

🚨 If a unit is set to factory defaults, an uploaded certificate or updated firmware will be preserved.

1) via push button:

- Activate the Bootloader Mode of the device
Operating

- Hold down the button (or the "Select" button for devices with 2 buttons) for 6 seconds. If the push button is recessed, use a pin or paper clip
- The status LED will blink in a fast rhythm, please wait until the LED blinks slowly (about 5 seconds)

2) by Software:

- Activate the Bootloader Mode of the device
- "Start the GBL_Conf.exe" program
- In menu "Program Device" activate the item "Reset to Fab Settings"
- The status LED will blink in a fast rhythm, please wait until the LED blinks slowly (about 5 seconds)
Configuration
3 Configuration

TCP/IP configuration by DHCP

After switching on the device is scanning on the Ethernet for a DHCP server and requests an unused IP address. Check the IP address that has been assigned and adjust if necessary, that the same IP address is used at each restart. To turn off DHCP use the software GBL_Conf.exe or use the configuration via the web interface.

To check the network settings with GBL_Conf.exe, start the program and choose "All Devices" in the "Search" menu. From the list select the appropriate device. The lower part of the left half of the window now shows the current network settings of the device. If the IP address is displayed with the default settings (192.168.0.2), either no DHCP server is present on the network, or there could be no free IP address assigned to it.

3.1 Output Ports

Choose Output Port to configure: This field is used to select the Output Ports to be configured.

Label: You can assign a name up to 15 characters for each of the Output Ports. Using the name, an identification of the the device connected to the port can be facilitated.

Start-up Monitoring

It is important, that if necessary the condition of the Output Ports can be restored after a power failure. Therefore each port can be configured with Initialization status to a specific start-up state. This start-up sequence can be carried out delayed by the parameter Initialization Delay. There is in any case a minimum one-second delay between switching of ports.

Initialization status(coldstart): This is the port state (on, off, remember last state) the port should be set when the device is turned on. The setting "remember last state" saves the last manually set state of the Output Port in the EEPROM.

Initialization delay: Here can be configured how long the port should wait to switch to its defined state after the device is turned on. The delay may last up to 8191 seconds. This
corresponds to a period of approx. two hours and 20 minutes. A value of zero means that the initialization is off.

**Repower delay:** When this feature is enabled (value greater than 0), the Output Port will switch itself on again a specified time after it has been disabled. Unlike the "Reset" button this function applies to all switch actions, including SNMP, or an optional serial interface.

**Reset Duration:** When the "Reset" button is triggered, the device turns the Output Port off, waits for the time entered here (in seconds) and turns the Output Port on.

### 3.1.1 Watchdog

The watchdog feature enables to monitor various remote devices. Therefore either ICMP pings or TCP pings are sent to the device to be monitored. If these pings are not answered within a certain time (both the time and the number of attempts can be set), the port is reset. This allows e.g. to automatically restart not responding server or NAS systems. The mode IP master-slave port allows you to switch a port depending on the availability of a remote device.

When a watchdog is activated it presents various information in the Control Panel. The information is color-coded.

- Green text: The watchdog is active and regularly receives ping replies.
- Orange text: The watchdog is currently enabled, and waits for the first Ping response.
- Red text: The watchdog is active and receives no ping replies anymore from the configured IP address.

After the watchdog has been enabled, the display remains orange until the watchdog receives a ping response for the first time. Only then the watchdog is activated. Even after triggering a watchdog and a subsequent power port reset, the display will remain orange until the device is rebooted and responds again to ping requests. This will prevent a premature watchdog reset of the port, e.g. when a server needs a long time for a file check.

You can monitor devices on your own network, as well as devices on an external network, e.g. the operating status of a router.
Enable watchdog: Enables the watchdog function for this Power Port.

Watchdog type: Here you can choose between the monitoring by ICMP pings or TCP pings.

- ICMP Pings: The classic ping (ICMP echo request). It can be used to check the accessibility of network devices (for example, a server).
- TCP Pings: With TCP pings, you can check if a TCP port on the target device would accept a TCP connect. Therefore a non-blocked TCP port should be selected. A good choice would be port 80 for http or port 25 for SMTP.

TCP port: Enter the TCP port to be monitored. When using ICMP pings this is not needed.

Hostname: The name or IP address of the monitored network device.

Ping interval: Select the frequency (in seconds) at which the ping packet is sent to each network device to check its operating status.

Ping retries: After this number of consecutive unanswered ping requests the device is considered inactive.

Watchdog mode: When Reset port when host down is enabled, the Power Port is turned off and switched back on after the time set in Reset Duration. In mode Switch off once when host down the Power Port remains disabled.

At the default setting (Infinite wait for booting host after reset) the watchdog monitors the connected device. When there is no longer a reply after a set time, the watchdog performs the specified action, usually a reset of the Power Port. Now the watchdog waits until the monitored device reports again on the network. This may take several minutes depending on the boot duration of the device. Only when the device is accessible from network again, the watchdog is re-armed. If the option Repeat reset on booting host after x ping timeout is enabled, this mechanism is bypassed. Now the watchdog is re-activated after N Ping intervals (input field ping timeouts).

When enabling the IP master-slave mode, the port is switched depending on the availability of a remote device. Depending on the configuration, the port is switched on when the terminal is reachable, or vice versa.

⚠️ The option Repeat reset on booting host after x ping timeout has the following pitfall: If a server, that is connected to the monitored Port is in need for a long boot process (e.g. it is doing a file system check), the server would probably exceed the tripping time of the watchdog. The server would be switched off and on again, and the file system check is restarted. This would be repeated endlessly.

count PING requests as unreplied when ethernet link down: If the Ethernet link of the device is not active, watchdog monitoring is not possible and the watchdog function is not activated. If this option is activated, a watchdog is also triggered if the Ethernet link is down.
3.2 **Input Ports**

**Choose Input port to configure:** This field is used to select the input port to be configured.

**Name:** You can assign a name up to 15 characters for each of the Input Ports. Using the name, an identification of the device connected to the port can be facilitated.

**Inverted Input:** Inverts the assignment of the input signal to a logical HI / LOW state.

**Input HI Text Message:** Text display in the control panel and messages when a HI signal is present at the input port.

**Input LOW Text Message:** Text display in the control panel and messages when a LOW signal is present at the input port.

**Enable input events:** Enables Input Port monitoring.

**Message Channels:** Enables the generation of messages on different channels.

**Console push-messages:** This option allows the output of sensor values on the console at a configured time interval, or when a certain threshold has been reached.

**On input is HI:** Switching action when Input Port changes from LOW to HI.

**On input is LOW:** Switching action when Input Port changes from HI to LOW.

**Console push-messages:** This option allows the output of sensor values on the console at a configured time interval, or when a certain threshold has been reached.
3.3 Ethernet

### 3.3.1 IP Address

**Hostname:** Here you can enter a name with up to 63 characters. This name will be used for registration on the DHCP server.

⚠ Special characters and umlauts can cause problems in the network.

**IPv4 Address:** The IP address of the device.

**IPv4 Netmask:** The network mask used in the network.

**IPv4 Gateway address:** The IP address of the gateway.

**IPv4 DNS address:** The IP address of the DNS server.

**Use IPv4 DHCP:** Select "yes" if the TCP/IP settings should be obtained directly from the DHCP server: When the function is selected, each time the device powers up it is checked if a DHCP server is available on the network.

⚠ If no DHCP server is available, the last IP address is used. However, the DHCP client tries to reach a DHCP server again every 5 minutes. The DHCP request lasts one minute until it is aborted. During this time the IP-address is not accessible! It is therefore essential to deactivate DHCP for a static IP addresses!

**Use IPv6 Protocol:** Activates IPv6 usage.

**Use IPv6 Router Advertisement:** The Router Advertisement communicates with the router...
to make global IPv6 addresses available.

**Use DHCP v6**: Requests from an existing DHCPv6 server addresses of the configured DNS server.

**Use manual IPv6 address settings**: Activates the entry of manual IPv6 addresses.

**IPv6 status**: Displays the IPv6 addresses over which the device can be accessed, and additionally DNS and router addresses.

![IPv6 status](image)

⚠️ For IP changes a firmware reset is required. This can be done in the Maintenance web page. A restart of the device leads by no means to a change of the relay states.

**Manual IPv6 Configuration**

![IPv6 (manual)](image)

The input fields for the manual setting of IPv6 addresses allow you to configure the prefix of four additional IPv6 device addresses, and to set two DNS addresses, and a gateway.

### 3.3.2 IP ACL
## Configuration

### ICMP Ping

Reply ICMP ping requests:  ☑️ yes ☐ no

### IP Access Control List

Enable IP filter:  ☑️ yes ☐ no

- 1. Grant IP access to host/net: `1234::4e00:0000:0000:0000:0000:0000:0000` - +
- 2. Grant IP access to host/net: `192.168.1.84` - +
- 3. Grant IP access to host/net: `mypc.local` - +
- 4. Grant IP access to host/net: `192.168.1.0/24` - +
- 5. Grant IP access to host/net: `1234::4e00:0000:0000:0000:0000:0000:0000:0000` - +

### Notes

**Reply ICMP ping requests:** If you enable this feature, the device responds to ICMP pings from the network.

**Enable IP filter:** Enable or disable the IP filter here. The IP filter represents an access control for incoming IP packets.

⚠️ Please note that when IP access control is enabled HTTP and SNMP only work if the appropriate servers and clients are registered in the IP access control list.

⚠️ If you choose a wrong IP ACL setting and locked yourself out, please activate the Bootloader Mode and use GBL_Conf.exe to deactivate the IP ACL. Alternatively, you can reset the device to factory default.
3.3.3 HTTP

**HTTP Server option**: Selects whether access is possible only with HTTP, HTTPS, or both.

**Server port HTTP**: Here can be set the port number of the internal HTTP. Possible values are from 1 to 65534 (default: 80). If you do not use the default port, you must append the port number to the address with a colon to address the device from a web browser. Such as: "http://192.168.0.2:800"

**Server port HTTPS**: The port number to connect the web server via the SSL (TLS) protocol.

**Supported TLS versions**: Limits the supported TLS versions.

**Enable Ajax autorefresh**: If this is activated, the information of the status page is automatically updated via http request (AJAX).

⚠️ For some HTTP configuration changes a firmware reset is required. This can be done in the Maintenance web page. A restart of the device leads by no means to a change of the relay states.

**Enable password protection**: Password access protection can be activated. If the admin password is assigned, you can only log in by entering this password to change settings. Users can log in by entering the user password in order to query the status information and initiate switching operations.
Configuration

Use radius server passwords: Username and password are validated by a Radius Sever.

Use locally stored passwords: Username and password are stored locally. In this case, an admin password and a user password must be assigned. The password can have a maximum of 31 characters. The name "admin" and "user" are provided for the user name in the password entry mask of the browser. In factory settings, the password for the admin is set to "admin" or "user" for the user password.

⚠️ If the password mask is redisplayed, only four "bullets" are shown as a symbolic placeholder, since for security reasons the device never stores the password itself, but only the SHA2-256 hash. If you want to change a password, the complete password must always be re-entered.

⚠️ If you have forgotten your password, please activate the bootloader mode and then turn off the password prompt in GBL_Conf.exe.

3.4 Protocols

3.4.1 Console

TCP/IP Console

Enable Telnet: ☐ yes ☐ no
Telnet TCP port: 23

Raw mode: ☐ yes ☐ no
Active negotiation: ☐ yes ☐ no
Activate echo: ☐ yes ☐ no
Push messages: ☐ yes ☐ no
Delay after 3 failed logins: ☐ yes ☐ no

Enable SSH: ☐ yes ☐ no
SSH TCP port: 22
Activate echo: ☐ yes ☐ no
Push messages: ☐ yes ☐ no

Require user login (Telnet/SSH): ☐ yes ☐ no
Use radius server passwords: ☐ yes ☐ no
Use locally stored passwords: ☐ yes ☐ no

Username: telnet
Set new password: •••• (32 characters max)
Repeat password: ••••
Upload new SSH public key:
**Telnet**

*Enable Telnet:* Enables the Telnet console.

*Telnet TCP port:* Telnet sessions are accepted on this port.

*Raw mode:* The VT100 editing and the IAC protocol are disabled.

*Active negotiation:* The IAC negotiation is initiated by the server.

*Activate echo:* The Telnet echo setting if not changed by IAC.

*Push messages:* Sends push messages via SSH.

*Delay after 3 failed logins:* After 3 wrong entries of username or password, the next login attempt is delayed.

**SSH**

*Enable SSH:* Enables the SSH protocol.

*SSH TCP port:* Port on which SSH sessions are accepted.

*Activate echo:* The echo setting for SSH.

*Push messages:* Sends push messages via SSH.

**SSH and Telnet**

*Require user login:* Username and password are required.

*Use radius server passwords:* Username and password are validated by a Radius Server.

*Use locally stored passwords:* Username and password are stored locally.

*Upload SSH public key:* Input field for public key.

*Delete public key:* Setting this at Apply deletes the public key.
### Configuration

#### Serial console

- **Enable serial console**: Enables the serial console.
- **Raw mode**: The VT100 editing is disabled.
- **Activate echo**: The echo setting.
- **Enable binary KVM protocol**: Additionally activates the KVM protocol.
- **Enable UTF8 support**: Enables character encoding in UTF8.
- **Push messages**: Sends push messages via serial console.
- **Require user login**: Username and password are required.
- **Delay after 3 failed logins**: After 3 wrong entries of username or password, the next login attempt is delayed.
- **Use radius server passwords**: Username and password are validated by a Radius Sever.
- **Use locally stored passwords**: Username and password are stored locally.

#### Syslog

- **Enable Syslog**: Enables Syslog.
- **Syslog server**: The server for syslog messages.

---

3.4.2 Syslog

---

35
**Enable Syslog**: Enables the usage of Syslog Messages.

**Syslog Server**: If you have enabled Syslog Messages, enter the IP address of the server to which the syslog information should be transmitted.

### 3.4.3 SNMP

**SNMP-get**: Enables the acceptance of SNMP-GET commands.

**SNMP-set**: Allows the reception of SNMP-SET commands.

**SNMP UDP Port**: Sets the UDP port where SNMP messages are received.

**sysContact**: Value of RFC 1213 sysContact.

**sysName**: Value of RFC 1213 sysName.

**sysLocation**: Value of RFC 1213 sysLocation.
Configuration

Enable SNMP v2: Activates SNMP v2.

⚠️ Because of security issues, it is advisable to use only SNMP v3, and to disable SNMP v2. Accesses to SNMP v2 are always insecure.

Community public: The community password for SNMP GET requests.

Community private: The community password for SNMP SET requests.

Enable SNMP v3: Activates SNMP v3.

SNMP v3 Username: The SNMP v3 User Name.

SNMP v3 Privacy Algorithm: SNMP v3 Encryption Algorithm.

⚠️ If the password mask is redisplayed, only four “bullets” are shown as a symbolic placeholder, since for security reasons the device never stores the password itself, but only the key formed using the Authorization Algorithm. If you want to change a password, the complete password must always be re-entered.

⚠️ The calculation of the password hashes varies with the selected algorithms. If the Authentication or Privacy algorithms are changed, the passwords must be re-entered in the configuration dialog. “SHA-384” and “SHA-512” are calculated purely in software. If “SHA-512” is set on the configuration page, the time for the key generation may take once up to approx. 45 seconds.

Send SNMP traps: Here you can specify whether, and in what format the device should send SNMP traps.

SNMP trap receiver: You can insert here up to eight SNMP trap receiver.

MIB table: The download link to the text file with the MIB table for the device.

More information about SNMP settings are available from our support or can be found on the Internet at www.gude.info/wiki.

3.4.4 Radius
Enable Radius Client: Enables validation over Radius.

Use CHAP: Use CHAP password encoding.

Use Message Authentication: Adds the "Message Authentication" attribute to the Authentication Request.

Primary Server: Name or IP address of the Primary Radius server.

Shared secret: Radius Shared Secret. For compatibility reasons, only use ASCII characters.

Timeout: How long (in seconds) will be waited for a response from an Authentication Request.

Retries: How often an authentication request is repeated after a timeout.

Use Backup Server: Activates a Radius Backup server.

Backup Server: Name or IP address of the Radius Backup server.

Shared secret: Radius Shared Secret. For compatibility reasons, only use ASCII characters.

Timeout: How long (in seconds) will be waited for a response from an Authentication Request.

Retries: How often an authentication request is repeated after a timeout.
**Test Radius Server**

- **Test Username**: Username input field for Radius test.
- **Test Password**: Password input field for Radius test.

The "Test Radius Server" function allows you to check whether a combination of Username and Password is accepted by the configured Radius Servers.

### 3.4.5 Modbus TCP

**Enable Modbus TCP**: Enables Modbus TCP support.

**Modbus TCP port**: The TCP/IP port number for Modbus TCP.
3.4.6 MQTT

Enable MQTT: Enables MQTT support.

Broker: DNS or IP address of the MQTT broker.

TLS: Turns on TLS encryption.

Mode TCP port: The TCP/IP port number of the broker.

Username: The MQTT username.

password: The password for the username.

Client ID: The MQTT client ID.

⚠️ The client IDs of a user must be different! If two clients of a user have the same name, the connection of one client is normally terminated.

Quality of Service (QoS): Sets the QoS value (0 or 1) of the MQTT publishes.

Keep-alive ping interval: This defines the time interval in which the client sends an MQTT ping.

Topic prefix: Defines the beginning of the topic with which all messages are sent. The strings [mac] and [host] symbolize the MAC address or the hostname of the device.

Permit CLI commands: Enables the execution of console commands.

Publish device data summary interval: Time interval in which messages with the global status of the device are sent.
**Configuration**

**MQTT Logs**: Outputs individual log messages about the connection setup.

**MQTT Broker Status**: Time information about connection duration, the last publish and the last keep-alive.

### 3.5 Clock

#### 3.5.1 NTP

**Enable Time Synchronization**: Enables the NTP protocol.

**Primary NTP server**: IP address of the first NTP server.

**Backup NTP server**: IP address of the second NTP server. Used when the first NTP server does not respond.

**Timezone**: The set time zone for the local time.
Daylight Saving Time: If enabled, the local time is converted to Central European Summer Time.

set manually: The user can set a time manually.

set to Browsertime: Sets the time corresponding to web browser.

⚠️ If Time synchronization is enabled, a manual time will be overwritten at the next NTP synchronization.

3.5.2 Timer

Enable Timer: Enables or disables all timers globally.

Syslog verbosity level: Sets the verbosity level for timer syslog output.

New Rule simple Timer: Shows a dialog for a simple timer rule.

New Rule advanced Timer: Brings up the dialog for advanced timer settings.

3.5.3 Timer Configuration

In the timer configuration you have three options: Create a simple timer, add a complex timer, or change an existing configuration.

⚠️ Timer rules are only executed if the device has a valid time. See configuration NTP.

⚠️ This instruction chapter applies to all Gude devices. For devices without switchable ports you can only create a complex timer. For an action there is only the register "Action CLI" available, and not the register "Action PortSwitch".
Creating a simple timer

If you activate "New Rule: simple Timer" the following dialog is displayed:

You set here which port should be switched for which time period, and on which days of the week the rule is active. In this example the period 9:00 to 17:00 is changed to 9:30 to 11:00 compared to the default input mask. Also, this rule should not be applied on Saturday and Sunday. The rule we have now says that every day, except Saturday and Sunday, port 1 will be switched on at 9:30 and switched off after 1.5 hours. Clicking on "Save" saves this rule.

We have now created 2 rules, one for when the port is turned on and the second for when it is turned off.

Creating a complex timer
If you create a complex timer or change an existing timer, you will always see an extended dialog. Here, ports can be switched as well as other actions can be executed via CLI commands. The setting of the switching times is more granular.

You can see here the extended representation of the first rule of the simple timer from the previous example. The action is started every day of every month at 9:30. The weekdays Saturday and Sunday are excluded. An existing rule can be removed with the "Delete" button.

If a rule is deleted, the following rules move up. The numbering of the following rules also changes by one. This also applies to the index in the console commands.

A simple timer is directly "enabled", for a newly created complex timer "enable trigger" must be switched on manually. You can set a probability and a jitter for the timer rules. This makes random events possible. In this example the rule is executed with 100% probability. A jitter of 0 means that the action takes place exactly at the programmed time. Ports are switched as action mode, alternatively a console command (CLI Cmd) can be executed.

After changes to existing timers, the "Rule Name" may no longer be meaningful. To keep the overview, it may be useful to adjust the name.
The switching function can be set in more detail on the "Action PortSwitch" register. Port 1 is switched on. You could extend the rule and switch more ports on or off. Additionally, you can set a time for a batch mode in the field after "Between Action 1 and Action 2: wait", which starts "Action 2" after expired time. However, the batch mode has the disadvantage that it is not automatically restarted when the device is rebooted. Also, the port is locked against manual operation on the web page as long as the batch mode is running.

⚠️ The "Action PortSwitch" function is only available for devices with switchable ports.

### Extending a rule

For demonstration purposes, here is an extension to the simple timer from the previous example:

![Timer configuration interface](image)

The action is now started not only at 9:30, but also at 17:30. There are other changes: The timer is only active between October and December, also the action does not take place on the first day of a month.

⚠️ Since all fields in the mask are always considered, it is not possible to define the times 9:30 and 17:10 in a single timer rule. You need a second rule for this. If you set the hours 9 and 17, as well as the minutes 10 and 30, then the four times 9:10, 9:30,
17:10 and 17:30 would be programmed.

To change a field in this input mask without changing the state of the other fields, the Ctrl key must be pressed during the mouse click.

For this rule, on the "Options" tab, the time period is limited to the range between 5.10.2021 and 5.4.2022. In this example, the timer rule is only executed with a probability (Random Trigger Probability) of 90%.

In this example, port 1 and port 5 are enabled and disabled after 90 minutes by batch mode.

A popup on the mouse pointer shows the port number of the field.

**Console Commands**
Instead of switching a port, one or more console commands can be executed. These commands are entered in the "Action CLI" register. The "Action CLI" tab can only be selected if the option "Perform CLI Cmd" is activated in "Options".

**Example Switching a Port on a Date**

If you want to switch on a timer on a certain date at a certain time and switch it off at a later time, you cannot do it directly with a simple timer. Therefore it can be useful to create the timer as a simple timer first, and then customize it in the advanced dialog.

Switch port 3 on every day at 9:25, and off again at 17:30. You save.
Then call up the two timer rules you created ("On" and "Off") and enter the date on which the switching operation is to take place in the "Options" tab.

**Example blind control**

You can use the jitter e.g. for a shutter control. In the classic example of a shutter control, you do not always want to raise and lower the shutters at the same time in order to confuse potential burglars. The jitter of 1800 seconds means that the action is executed randomly in a period between 30 minutes before and 30 minutes after the programmed time. The probability (Random Trigger Probability) of execution here is 100%.
3.6 Sensors

Sensor: Selects a type of sensor to configure it. The first digit "1" indicates the number of the sensor port (only important for devices with more than one sensor port). This is followed by the sensor name, and the changeable sensor name.

Sensor Name: Changeable name for this sensor. Temperature and humidity can have different names, even if they are from the same sensor.

Select Sensor Field: Selects a data channel from a sensor.

Enable Messages: Enables the generation of sensor messages.

Maximum/Minimum value: Here you can choose whether, and at what Maximum/Minimum temperature or humidity measurements limits the alerts are send via SNMP traps, syslog or E-Mail.

Hysteresis: This describes the margin of when an event is generated after the measured value has crossed the chosen limit.

Message channels: Enables the generation of messages on different channels.

Console push-messages: This option allows the output of sensor values on the console at a configured time interval, or when a certain threshold has been reached.

Min/Max measurement period: Selects the time range for the sensor min/max values on the overview web page.
Hysteresis Example:

A Hysteresis value prevents that too much messages are generated, when a sensor value is jittering around a sensor limit. The following example shows the behavior for a temperature sensor and a hysteresis value of "1". An upper limit of "50 °C" is set.

Example:

49.9 °C - is below the upper limit
50.0 °C - a message is generated for reaching the upper limit
50.1 °C - is above the upper limit
...

49.1 °C - is below the upper limit, but in the hysteresis range
49.0 °C - is below the upper limit, but in the hysteresis range
48.9 °C - a message is generated for underrunning the upper limit inclusive hysteresis range
...

3.6.1 Port Switching

Depending on the measured Current and the measured sensor values, switching actions can be triggered. During operation, the actions configured for crossing the limits are executed. For example, when a value moves from the range "above max value" inside the range "below max value", the action defined for "below max value" is performed. In the case of device start, configuration or plug-in of the sensor, the actions corresponding to the range in which the current temperature is located are switched.

Example with "Maximum value" of 65 °C, "Minimum value" of 25 °C and hysteresis of 3 °C. The dotted line shows the hysteresis.
Actions during configuration, device start or plugging in the sensor (for given example):

<table>
<thead>
<tr>
<th>actual temperature during configuration</th>
<th>actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>70 °C</td>
<td>Port 1 Off (above max) + Port 2 On (above min)</td>
</tr>
<tr>
<td>45 °C</td>
<td>Port 1 On (below max) + Port 2 On (above min)</td>
</tr>
<tr>
<td>20 °C</td>
<td>Port 1 On (below max) + Port 2 Off (below min)</td>
</tr>
</tbody>
</table>

Action matrix during operation when limit values are exceeded (for given example):

<table>
<thead>
<tr>
<th>from &quot;above max&quot;</th>
<th>to &quot;above max&quot;</th>
<th>to &quot;below max&quot;</th>
<th>to &quot;above min&quot;</th>
<th>to &quot;below min&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1 Off</td>
<td>P1 On</td>
<td>P1 Off</td>
<td>P1 On + P2 Off</td>
<td></td>
</tr>
<tr>
<td>P1 Off</td>
<td>-</td>
<td>-</td>
<td>P2 Off</td>
<td></td>
</tr>
<tr>
<td>P1 Off</td>
<td>-</td>
<td>-</td>
<td>P2 Off</td>
<td></td>
</tr>
<tr>
<td>P1 Off + P2 On</td>
<td>P2 On</td>
<td>P2 On</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

⚠️ Only the switching operations for which actions have been defined, are triggered. If no "On" or "Off" action is defined for a port, the port can never reach this state by exceeding sensor values. Unless it is the initial state.

### 3.7 E-Mail

Enable E-Mail: Activates the E-Mail dispatch of messages.
Configuration

Sender address: The E-Mail address of the sender.

Recipient address: The E-Mail address of the recipient. Additional E-Mail addresses, separated by comma, can be specified. The input limit is 100 characters.

SMTP Server: The SMTP IP-address of the E-Mail server. Either as FQDN, e.g: "mail.gmx.net", or as IP-address, e.g: "213.165.64.20". If required, attach a designated port, e.g: "mail.gmx.net:25".

SMTP server port: The port address of the E-Mail server. In the normal case this should be the same as the default, that is determined by the setting SMTP Connection Security.

SMTP Connection Security: Transmission via SSL or no encryption.

Username: User name that is registered with the SMTP E-Mail server.

Set new password: Enter the password for the login to the E-Mail server.

Repeat password: Enter the password again to confirm it.

⚠️ If the password mask is redisplayed, only four "bullets" are shown as a symbolic placeholder, since for security reasons the password is never shown itself. If you want to change a password, the complete password must always be re-entered.

E-Mail Logs: Logging of E-Mail system messages.

3.8 Front Panel

Button Lock: Enables or disables the front buttons (activates the key lock) with the exception of the bootloader activation.

Allow switching all ports: Allows to switch all ports on or off with the front panel buttons.
Specifications
4 Specifications

4.1 Automated Access

The device can be accessed automatically via four different interfaces, which offer different possibilities to access the configuration data and status information. Only http and the console (telnet and serial) provide full access to the device.

⚠️ This chapter is general for all Gude devices. Depending on the device model are ports, certain sensors or other features not available.

List of different access options:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Scope of Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP</td>
<td>read / write status of Power Ports (relays or eFuses)</td>
</tr>
<tr>
<td></td>
<td>read / write all configuration data</td>
</tr>
<tr>

</tbody>
</table>

The device can be controlled via HTTP interface with CGI commands and returns the internal configuration and status in JSON format. The structure of the CGI commands and the JSON data is explained in more detail in our Wiki article:
http://wiki.gude.info/EPC_HTTP_Interface

4.2 Messages

Depending on adjustable events, various messages can be sent from the device. The fol-
lowing message types are supported:

- Sending of e-mails
- SNMP Traps
- Syslog messages

**E-Mail messages**

Email messages are triggered by the following events:

- Switching of the Ports
- Exceeding of the max / min values of attached sensors
- State change of digital sensor input ports

**SNMP Traps**

SNMP Traps are system messages that are sent via the SNMP protocol to different recipients. SNMP traps are triggered by the following events:

- Switching of the Ports
- Exceeding of the max / min values of attached sensors
- State change of digital sensor input ports

**Syslog messages**

Syslog messages are simple text messages that are sent via UDP to a syslog server. Under Linux, normally a syslog daemon is already running (e.g., syslog-ng), for Microsoft Windows systems some freeware programs are available on the market. The syslog messages are sent for the following events:

- Turning on the device
- Enable/disable of syslog in the configuration
- Switching of the Ports
- Exceeding of the max / min values of attached sensors
- State change of digital sensor input ports

SNMP traps

There are common traps for state changes of the same device resource. For example, a SwitchEvtPort trap is sent when a port is turned on or off. The state change itself is conveyed by the supplied data within the trap.

MQTT published data

Messages on the MQTT channel are sent in JSON format.

Example switch a port: 

```
{"type": "portswitch", "idx": 2, "port": "2", "state": 1, "cause":
{"id": 2, "txt": "http"}, "ts": 1632}
```

Console Push Messages

Push messages can be activated on the console channels (Telnet, SSH or serial console), which output sensor values at timed intervals (every n seconds) or as of a configurable change in the magnitude of the sensor value on that channel. The generated message always starts with a "#" and ends with a CR/LF.

Example: Switch a port: 

```
#port 2 ON
```

If you open a telnet or SSH connection, the push messages are either preconfigured, or you switch on the push messages temporarily with "console telnet pushmsgs set 1" (or "console ssh pushmsgs set 1"). From now on, push messages will be sent asynchronously on this channel. The asynchronous nature of the messages can cause problems on a connection if you send commands yourself at the same time. There are then the possibilities:

- Filter all incoming characters between "#" and CR/LF
- or open a second channel (Telnet, SSH, serial) and switch on the push messages there.

4.3 IP ACL

IP Access Control List

The IP Access Control List (ACL IP) is a filter for incoming IP packets. If the filter is active, only the hosts and subnets whose IP addresses are registered in the list, can contact via HTTP or SNMP, and make changes. For incoming connections from unauthorized PCs, the device is not completely transparent. Due to technical restraints, a TCP/IP connection will be accepted at first, but then rejected directly.

Examples:

<table>
<thead>
<tr>
<th>Entry in the IP ACL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.0.123</td>
<td>the PC with IP Address &quot;192.168.0.123&quot; can access the device</td>
</tr>
</tbody>
</table>
## Specifications

<table>
<thead>
<tr>
<th>Entry in the IP ACL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.0.1/24</td>
<td>all devices of subnet &quot;192.168.0.1/24&quot; can access the device</td>
</tr>
<tr>
<td>1234:4ef0:eec1:0::/64</td>
<td>all devices of subnet &quot;1234:4ef0:eec1:0::/64&quot; can access the device</td>
</tr>
</tbody>
</table>

⚠️ If you choose a wrong IP ACL setting and locked yourself out, please activate the Bootloader Mode and use GBL_Conf.exe to deactivate the IP ACL. Alternatively, you can reset the device to factory default.

### 4.4 IPv6

**IPv6 Addresses**

IPv6 addresses are 128 bit long and thus four times as long as IPv4 addresses. The first 64 bit form a so-called prefix, the last 64 bit designate a unique interface identifier. The prefix is composed of a routing prefix and a subnet ID. An IPv6 network interface can be reached under several IP addresses. Usually this is the case under a global address and the link local address.

**Address Notation**

IPv6 addresses are noted in 8 hexadecimal blocks at 16 bit, while IPv4 normally is noted in decimal. The separator is a colon, not a period.

E.g.: 1234:4ef0:0:0:0019:32ff:fe00:0124

Leading zeros may be omitted within a block. The previous example can be rewritten as:

1234:4ef0:0:0:19:32ff:fe00:124

One may omit one or more successive blocks, if they consist of zeros. This may be done only once within an IPv6 address!

1234:4ef0::19:32ff:fe00:124

One may use the usual decimal notation of IPv4 for the last 4 bytes:

1234:4ef0::19:32ff:254.0.1.36

### 4.5 Radius

The passwords for HTTP, telnet, and serial console (depending on the model) can be stored locally and / or authenticated via RADIUS. The RADIUS configuration supports a primary server and a backup server. If the primary server does respond, the RADIUS request is sent to the backup server. If the local password and RADIUS are enabled at the same time, the system is first checking locally, and then in the event of a failure the
Specifications

RADIUS servers are contacted.

RADIUS attributes

The following RADIUS attributes are evaluated by the client:

Session-Timeout: This attribute specifies (in seconds) how long an accepted RADIUS request is valid. After this time has elapsed, the RADIUS server must be prompted again. If this attribute is not returned, the default timeout entry from the configuration is used instead.

Filter-Id: If the value "admin" is set for this attribute, then admin rights are assigned for the login, otherwise only user access.

Service-Type: This is an alternative to Filter-Id. A service type of "6" or "7" means admin rights for the HTTP login, otherwise only limited user access.

HTTP Login

The HTTP login takes place via Basic Authentication. This means that it is the responsibility of the web server, how long the login credentials are temporarily stored there. The RADIUS parameter "Session-Timeout" therefore does not determine when the user has to login again, but at what intervals the RADIUS servers are asked again.

4.6 SNMP

SNMP can be used for status information via UDP (port 161). Supported SNMP commands are:

- GET
- GETNEXT
- GETBULK
- SET

To query via SNMP you need a Network Management System, such as HP OpenView, OpenNMS, Nagios etc., or the simple command line tools of NET-SNMP software. The device supports SNMP protocols v1, v2c and v3. If traps are enabled in the configuration, the device messages are sent as notifications (traps). SNMP Informs are not supported. SNMP Requests are answered with the same version with which they were sent. The version of the sent traps can be set in the configuration.

MIB Tables

The values that can be requested or changed by the device, the so-called "Managed Objects", are described in Management Information Bases (MIBs). These substructures are subordinate to so-called "OID" (Object Identifiers). An OID digit signifies the location of a value inside a MIB structure. Alternatively, each OID can be referred to with its symbol name (subtree name). The device's MIB table can be displayed as a text file by clicking on the link "MIB table" on the SNMP configuration page in the browser.

SNMP v1 and v2c
SNMP v1 and v2c authenticates the network requests by so-called communities. The SNMP request has to send along the so-called community public for queries (read access) and the community private for status changes (write access). The SNMP communities are read and write passwords. In SNMP v1 and v2 the communities are transmitted unencrypted on the network and can be easily intercepted with IP sniffers within this collision domain. To enforce limited access we recommend the use of DMZ or IP-ACL.

**SNMP v3**

Because the device has no multiuser management, only one user (default name "standard") is detected in SNMP v3. From the User-based Security Model (USM) MIB variables, there is a support of "usmStats ..." counter. The "usmUser ..." variables will be added with the enhancement of additional users in later firmware versions. The system has only one context. The system accepts the context "normal" or an empty context.

**Authentication**

The algorithms "HMAC-MD5-96" and "HMAC-SHA-96" are available for authentication. In addition, the "HMAC-SHA-2" variants (RFC7630) "SHA-256", "SHA-384" and "SHA-512" are implemented.

"SHA-384" and "SHA512" are calculated purely in software. If "SHA-384" or "SHA-512" is set on the configuration page, the time for the key generation may take once up to approx. 45 seconds.

**Encryption**

The methods "DES", "3DES", "AES-128", "AES-192" and "AES-256" are supported in combination with "HMAC-MD5-96" and "HMAC-SHA-96." For the "HMAC-SHA-2" protocols, there is currently neither RFC nor draft that will allow for cooperation with an encryption.

While in the settings "AES-192" and "AES256" the key calculation is based on "draft-blumenthalphoto-aes-usm-04", the methods "AES 192-3DESKey" and "AES 256-3DESKey" utilize a key generation, which is also used in the "3DES" configuration ("draft-reeder-snmpv3-usb-3desede-00"). If one is not an SNMP expert, it is recommended to try in each case the settings with and without "...- 3DESKey".

**Passwords**

The passwords for authentication and encryption are stored only as computed hashes for security reasons. Thus it is, if at all, very difficult to infer the initial password. However, the hash calculation changes with the set algorithms. If the authentication or privacy algorithms are changed, the passwords must be re-entered in the configuration dialog.

**Security**

The following aspects should be considered:

- If encryption or authentication is used, then SNMP v1 and v2c should be turned off. Otherwise the device could be accessed with it.
- If only authentication is used, then the new "HMAC-SHA-2" methods are superior to the MD5 or SHA-1 hashing algorithms. Since only SHA-256 is accelerated in hard-
Specifications

- For SHA-1, there are a little less attack scenarios than MD5. If in doubt, SHA-1 is preferable.
- Encryption "DES" is considered very unsafe, use only in an emergency for reasons of compatibility!
- For cryptologists it's a debatable point whether "HMAC-MD5-96" and "HMAC-SHA-96" can muster enough entropy for key lengths of "AES-192" or "AES-256".
- From the foregoing considerations, we would recommended at present "HMAC-SHA-96" with "AES-128" as authentication and encryption method.

Change in Trap Design

In older MIB tables, a separate trap was defined for each combination of an event and a port number. This results in longer lists of trap definitions for the devices. For example, from epc8221SwitchEvtPort1 to epc8221SwitchEvtPort12. Since new firmware versions can generate many more different events, this behavior quickly produces several hundred trap definitions. To limit this overabundance of trap definitions, the trap design has been changed to create only one specific trap for each event type. The port or sensor number is now available in the trap as an index OID within the variable bindings.

In order to recognize this change directly, the "Notification" area in the MIB table has been moved from sysObjectID.0 to sysObjectID.3. This way, unidentified events are generated until the new MIB table is imported. For compatibility reasons, SNMP v1 traps are created in the same way as before.

NET-SNMP

NET-SNMP provides a very widespread collection of SNMP command-line tools (snmpget, snmpset, snmpwalk etc.) NET-SNMP is among others available for Linux and Windows. After installing NET-SNMP you should create the device-specific MIB of the device in NET-SMP share directory, e.g. after

c:\usr\share\snmp\mibs

or

/usr/share/snmp/mibs

So later you can use the 'subtree names' instead of OIDs:

Name: snmpwalk -v2c -mALL -c public 192.168.1.232 gudeads
OID: snmpwalk -v2c -mALL -c public 192.168.1.232 1.3.6.1.4.1.28507

NET-SNMP Examples

Query Power Port 1 switching state:

snmpget -v2c -mALL -c public 192.168.1.232 epc822XPrtState.1

Switch on Power Port 1:

snmpset -v2c -mALL -c private 192.168.1.232 epc822XPrtState.1 integer 1
## 4.6.1 Device MIB 2302

Below is a table of all device-specific OID’s which can be accessed via SNMP. In the numerical representation of the OID the prefix "1.3.6.1.4.1.28507" (Gude Enterprise OID) was omitted at each entry in the table to preserve space. The example for a complete OID would be "1.3.6.1.4.1.28507.70.1.1.1.1". A distinction is made in SNMP OID’s in between tables and scalars. OID scalar have the extension ".0" and only specify a value. In SNMP tables the "x" is replaced by an index (1 or greater) to address a value from the table.

<table>

#### 4.7 SSL

**TLS Standard**

The device is compatible with TLS v1.1 to TLS v1.3 standards, but due to lack of security, SSL v3.0, TLS 1.0, and RC4, MD5, SHA1, and DES encryption are disabled. All ciphers use Diffie-Hellman key exchange (Perfect Forward Secrecy).

**TLS 1.3 performance**

The interaction of TLS 1.3 and unsecure certificates and a web browser with Chromium Engine (Google Chrome or MS Edge) can lead to performance losses, and thus longer loading times. In this constellation, the Chromium Engine does not correctly support the SSL Session Cache (Session Tickets) and the math unit of the embedded CPU may be overwhelmed with continuous RSA operations. There are some possible workarounds:

- Use secure certificates (official certificate authority or marked as secure in the OS)
- or use of the Firefox browser
- or use of ECC 256 (no RSA) certificates
- or configure to "TLS v1.2 only"

**Creating your own Certificates**

The SSL stack is supplied with a specially newly generated self-signed certificate. There is no function to generate the local certificate anew at the touch of a button, since the required random numbers in an embedded device are usually not independent enough. However, you can create new certificates and import them to the device. The server accepts RSA (2048/4096) and ECC (Elliptic Curve Cryptography) certificates.

Usually OpenSSL is used to create an SSL certificate. For Windows for example, there is the light version of Shining Light Productions. There you open a command prompt, change to the directory "C:\OpenSSL-Win32\bin" and set these environment variables:

```
set openssl_conf=C:\OpenSSL-Win32\bin\openssl.cfg
set RANDFILE=C:\OpenSSL-Win32\bin\.rnd
```

Here are some examples for the generation with OpenSSL:

**Creation of a self-signed RSA 2048-bit certificate**
openssl genrsa -out server.key 2048
openssl req -new -x509 -days 365 -key server.key -out server.crt

**RSA 2048-bit certificate with Sign Request:**

openssl genrsa -out server.key 2048
openssl req -new -key server.key -out server.csr
openssl req -x509 -days 365 -key server.key -in server.csr -out server.crt

The server keys should be created with "openssl genrsa". The Gude device processes keys in the traditional PKCS#1 format. This can be recognized by the fact that the generated key file starts with "-----BEGIN RSA PRIVATE KEY-----". If the file starts with "-----BEGIN PRIVATE KEY-----", the file is in PKCS#8 format and the key is not recognized. If you have only a key in PKCS#8 format, you can convert it to PKCS#1 with openssl: 

```
openssl rsa -in pkcs8.key -out pkcs1.key
```

**ECC Certificate with Sign Request:**

openssl ecparam -genkey -name prime256v1 -out server.key
openssl req -new -key server.key -out server.csr
openssl req -x509 -days 365 -key server.key -in server.csr -out server.crt

If you have created your key and certificate, both files are concatenated to one file:

**Linux:**

```
cat server.crt server.key > server.pem
```

**Windows:**

```
copy server.crt + server.key server.pem
```

The created server.pem can only be uploaded in the maintenance section of the device.

If several certificates (Intermediate CRT's) should also be uploaded to the device, one should make sure, that firstly the server certificate and secondly the Intermediates are assembled, e.g:

```
cat server.crt IM1.crt IM2.crt server.key > server.pem
```

An uploaded certificate will be preserved, when a device is put back to factory defaults.

**Performance Considerations**

If RSA 4096 certificates are used, the first access to the web server can take 8-10 seconds, because the math unit of the embedded CPU is highly demanded. After that, the parameters are in the SSL session cache, so all other requests are just as fast as with other certificate lengths. For a quick response even on the first access, we recommend RSA 2048-bit certificates that offer adequate security, too.
4.8 Console

For the configuration and control of the device, there is a set of commands with parameters that can be entered through a console. The console is available via Telnet, or for devices with RS232 port through using a serial terminal. It is not necessary to use Telnet, in Raw Mode a simple TCP/IP connection is sufficient to send commands. The communication can also be performed automated (e.g. via scripting languages). The console features are configured through the web interface.

Command Set

There are several command levels. The following commands are usable from each level:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>back</td>
<td>go back one level</td>
</tr>
<tr>
<td>help</td>
<td>all commands of the actual level</td>
</tr>
<tr>
<td>help all</td>
<td>show all commands</td>
</tr>
<tr>
<td>logout</td>
<td>logout (only when login required)</td>
</tr>
<tr>
<td>quit</td>
<td>quit console</td>
</tr>
</tbody>
</table>

The "help" command returns all the commands of the current level. If "help" is called from the top level, e.g. the line "http [subtopics]" appears. This means that there is another level for "http". With the command "http help" all commands below "http" are shown. Alternatively, with entering "http" you can select the http level, and "help" shows all the commands on the selected level. The command "back" again selects the top level. It is possible to use "help" at any position: "http passwd help" provides all commands that have the prefix "http passwd".

You will find a complete list of all possible device commands in the chapter "Cmd Overview".

Parameter

If parameters are expected for the command, the parameter may be passed as numeric or constant. If e.g. you get the following line as help:

```
http server set {http_both=0|https_only=1|http_only=2}
```

the following instruction pairs are equivalent:

```
http server set https_only
http server set 1
```

or

```
http server set https_both
http server set 0
```

Numerical parameters can be entered with different bases. Here is an example of the decimal value 11:
### Bit Field Parameter

Some parameters can take several values at the same time. In the following example, all values between 0 and 5 can be set. In the help, this can be recognized by the fact that the values are not separated by the "|" character, but by commas.

```
{"EVT_SYSLOG=0,EVT_SNMP=1,EVT_EMAIL=2,EVT_SMS=3,EVT_GSMEMAIL=4,EVT_BEEPER=5}
```

To set EVT_SYSLOG and EVT_EMAIL in a command, you can use the following syntax:

```
>extsensor 1 2 0 events type set "EVT_SYSLOG,EVT_EMAIL"
```

or numeric

```
>extsensor 1 2 0 events type set "0,2"
```

Additionally you can set all values with "ALLSET" or encode any bit pattern as hexadecimal with a syntax like "#7f1a".

### Return Values

If a command is unknown or a parameter is incorrect, the output "ERR." is given at the beginning of the line, followed by a description of the fault. Successful instructions without special return value will be acknowledged by "OK.". All other return values are output within a single line. There are of two exceptions:

1. Some configuration changes, that affect TCP / IP and UDP, need a restart to be applied. These parameters are output on two lines. In the first line the current value is shown, on the second row the value after a restart. In the "Cmd Overview" table this is marked with "Note 2".
2. Other configurations (such as the assigned IPv6 addresses) have several values that can change dynamically. This is marked with "Note 3" in the "Cmd Overview" table.

### Numerical Returns

For parameters that support constants, these constants are output as return values. To better deal with scripting languages, it may be easier to work only with numerical returns. The command "vt100 numeric set ON" enables that only numerical values appear.

### Comments
If you use a tool to send an entire file of commands via Telnet, it is helpful, if you can place comments in there. Beginning with the comment character "#", the remaining contents of a line is ignored.

Telnet

If the configuration "Raw Mode" is turned off, it is tried to negotiate the Telnet configuration between client and server using IAC commands. If this fails, the editing functions are not active, and the "Activate echo" option determines whether the characters sent to the Telnet server will be returned. Normally the client begins with the IAC negotiation. If this is not the case with the client, the device configuration "Active negotiation" should be turned on.

Raw Mode

If you want to use the console only automated, it may be advantageous to set the configuration "Raw mode" to "yes" and "Activate echo" to "no" to. Then there is no interfering interaction with the editor functions and there is no need to filter the sent characters to process the return values.

⚠️ If in the console "Raw mode" is activated but not in the used Telnet client, the IAC commands sent at the beginning can appear as interfering characters in the command line (partially invisible).

Editing

The following edit functions are available when the terminal supports VT100, and Raw Mode is deactivated. Entered characters are inserted at the cursor position.

<table>
<thead>
<tr>
<th>Keys</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left, Right</td>
<td>moves cursor left or right</td>
</tr>
<tr>
<td>Pos 1, End</td>
<td>moves cursor to the beginning or end of line</td>
</tr>
<tr>
<td>Del</td>
<td>deletes character under the cursor</td>
</tr>
<tr>
<td>Backspace</td>
<td>deletes character left of cursor</td>
</tr>
<tr>
<td>Up, Down</td>
<td>shows input lines history</td>
</tr>
<tr>
<td>Tab, Ctrl-Tab</td>
<td>completes the word at cursor</td>
</tr>
<tr>
<td>Ctrl-C</td>
<td>clears the line</td>
</tr>
</tbody>
</table>

Sensor Examples

a) External Sensors

>extsensor all show
E=1,L="7106",0="21.3°C",1="35.1%",3="1013hPa",4="5.2°C",5="16.0°C"
E=2,L="7102",0="21.2°C",1="35.4%",4="5.3°C",5="15.9°C"

The command lists one connected external sensor per line, and the individual measured values are separated by commas after the label name. The digit before the equal sign corresponds to the Index field in the External Sensor Table.
Specifications

>extsensor 1 0 value show
Displays temperature of the sensor at Port 1

b) Line Sensors

>linesensor all "0,1,2,3,12" show
L=1,L="Power Port",0="13000Wh",1="0W",2="225V",3="0A",12="998218s"
L=2,L="Power Port",0="13000Wh",1="0W",2="223V",3="0A",12="996199s"

This command outputs all line sensor values in one line. A list of all fields (according to
the energy sensor table) is transferred as parameter. In this example these are the fields
Absolute Active Energy (0), Power Active (1), Voltage (2), Current (3) and Reset Time
(12).

>linesensor 1 "0,1,2,3,12" show
>linesensor 1 1 show

These variants give the sensor values of the field list or of a sensor at Line-In 1.

⚠️ For devices with Overvoltage Protection, the "linesensor all" command also outputs
the state of the protection ("OVP=x"). A "1" means ok, a "0" a failure of the protection.

c) Port Sensors

>portsensor all "0,1,2,3,12" show
P=1,L="Power Port",0="13000Wh",1="0W",2="225V",3="0A",12="998218s"
P=2,L="Power Port",0="13000Wh",1="0W",2="223V",3="0A",12="996199s"

This command outputs all port sensor values in one line. A list of all fields (according to
the energy sensor table) is passed as parameter. In this example these are the fields
Absolute Active Energy (0), Power Active (1), Voltage (2), Current (3) and Reset Time
(12).

>portsensor 2 "0,1,2,3,12" show
>portsensor 2 1 show

These variants give the sensor values of the field list or a sensor to at Outlet Port 2.

d) Displaying Port Relays

>port all state 1 show
P1=ON,P2=OFF,P3=ON,P4=OFF,P5=OFF,P6=OFF,P7=OFF,P8=ON

The command "port all state {MODE0=0|MODE1=1|MODE2=2} show" returns the
switching state of all relays in 3 possible formats.

e) Switching Port Relays

#port all state set "1,2,12" 1
OK.
The command syntax "port all state set "{port_list}" {OFF=0|ON=1}" sets a list of ports to ON=1 or OFF=0.

### 4.8.1 SSH

The device supports SSH-2 connections with either public key authentication or user name and password. The "login" must be enabled for SSH. Users and passwords can be stored locally or retrieved via a radius server. If you want to use SSH in a terminal, **Activate echo** should be enabled.

**Public Keys**

The following public keys are accepted:

<table>
<thead>
<tr>
<th>Key type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA</td>
<td>2048, 4096</td>
</tr>
<tr>
<td>ECDSA</td>
<td>256, 384</td>
</tr>
</tbody>
</table>

**Generation with PuTTYgen**

Generated keys can be copied directly from e.g. PuTTYgen,

and inserted into the Configuration - Console input field. Public keys are accepted in SSH2 or OpenSSH format.
**Specifications**

### Generation with ssh-keygen

The tool ssh-keygen is mostly shipped with Linux and Windows to generate SSH keys. Here is an example to generate an ECDSA 384 key.

```
ssh-keygen -t ecdsa -b 384 -f ssh.key
```

In the file ssh.pub is then the private key, the content of ssh.key.pub is inserted into the field "Upload SSH public key:".

---

### 4.8.2 Console Cmd 2302

</table>
Specifications

mqtt {broker_idx} client show  
shows client name

mqtt {broker_idx} qos set {QOS0=0|QOS1=1}  
sets QoS level

mqtt {broker_idx} qos show  
shows QoS level

mqtt {broker_idx} keepalive set {num_secs}  
sets keep-alive time

mqtt {broker_idx} keepalive show  
shows keep-alive time

mqtt {broker_idx} topic set "{name}"  
sets topic prefix

mqtt {broker_idx} topic show  
shows topic prefix

mqtt {broker_idx} console enabled set {OFF=0|ON=1}  
permits console cmds

mqtt {broker_idx} console enabled show  
shows if console cmds allowed

mqtt {broker_idx} device data timer set {num_secs}  
sets telemetry interval

mqtt {broker_idx} device data timer show  
shows telemetry interval

port  
Enteres cmd group "port"

port {port_num} state set {OFF=0|ON=1}  
sets port state

port {port_num} state show  
shows port state

port all state set "{port_list}" {OFF=0|ON=1}  
sets several ports in one cmd - e.g. port all state set "1,3,5" 1

port all state {MODE0=0|MODE1=1|MODE2=2} show  
shows all port states in 3 different view modes

port all set {OFF=0|ON=1|OFF_REV=2|ON_REV=3}  
switches all ports on/off forward or reverse

port all set {REINIT=0|OFF_REV_REINIT=1,OFF_REINIT=2}  
reinit coldstart sequence (optional first all off)

port {port_num} reset  
start reset sequence for port

port {port_num} toggle  
toggles port

port {port_num} batch set {OFF=0|ON=1} wait {num_secs} {OFF=0|ON=1}  
starts batch mode for port

port {port_num} batch cancel  
cancels batch mode

port {port_num} label set "{name}"  
sets port label name

port {port_num} label show  
shows port label name

port {port_num} initstate coldstart set {OFF=0|ON=1|REMEMBER=2}  
sets port coldstart initialization

port {port_num} initstate coldstart show  
shows port coldstart initialization

port {port_num} initstate delay set {num}  
sets port init delay

port {port_num} initstate delay show  
shows port init delay

port {port_num} repowerdelay set {num}  
sets port repower delay

port {port_num} repowerdelay show  
shows port repower delay

port {port_num} resettime set {num}  
sets port reset duration

port {port_num} resettime show  
shows port reset duration

port {port_num} watchdog enabled set {OFF=0|ON=1}  
sets port watchdog to on/off

port {port_num} watchdog enabled show  
shows port watchdog state

port {port_num} watchdog mode set {OFF=0|IPRESET=1|PORT_RESET=2|IP_MS=3|IP_MS_INV=4}  
sets port watchdog mode

port {port_num} watchdog mode show  
shows port watchdog mode

port {port_num} watchdog type set {WD_ICMP=0|WD_TCP=1}  
sets port watchdog type

port {port_num} watchdog type show  
shows port watchdog type

port {port_num} watchdog link down set {OFF=0|ON=1}  
sets if watchdog active when eth link down

port {port_num} watchdog link down show  
shows if watchdog active when eth link down

port {port_num} watchdog host set "{dns_name}"  
sets port watchdog host target

port {port_num} watchdog host show  
shows port watchdog host target

port {port_num} watchdog port set {ip_port}  
sets port watchdog TCP port

port {port_num} watchdog port show  
shows port watchdog TCP port

port {port_num} watchdog pinginterval set {num}  
sets port watchdog ping interval

port {port_num} watchdog pinginterval show  
shows port watchdog ping interval

port {port_num} watchdog pingretries set {num}  
sets port watchdog ping retries

port {port_num} watchdog pingretries show  
shows port watchdog ping retries

port {port_num} watchdog retrybooting set {OFF=0|ON=1}  
sets port watchdog retry booting to on/off

port {port_num} watchdog retrybooting show  
shows port watchdog retry booting state

port {port_num} watchdog bootretries set {num}  
sets port watchdog retry boot timeout

port {port_num} watchdog bootretries show  
shows port watchdog retry boot timeout

Specifications

**timer** `{rule_num}` action `{SWITCH1=0|SWITCH2=1}(OFF=0|ON=1)` set *"port_list"* 
sets port list for switch cmd

**timer** `{rule_num}` action `{SWITCH1=0|SWITCH2=1}(OFF=0|ON=1)` show 
shows port list for switch cmd

**timer** `{rule_num}` action delay set `{0..65535}` 
delay between cmds

**timer** `{rule_num}` action delay show 
shows delay between cmds

**timer** `{rule_num}` action console set *"cmd"*
sets cmd string

**timer** `{rule_num}` action console show 
shows cmd string

**timer** `{rule_num}` action hash set *"(data)"*
sets action binary form

**timer** `{rule_num}` action hash show 
shows action binary form

**timer** `{rule_num}` delete 
delete one timer

**timer delete all** 
delete all timer

**vt100** 
enters cmd group "vt100"

**vt100 echo set `{OFF=0|ON=1}`** 
sets console echo state

**vt100 echo show** 
shows console echo state

**vt100 numeric set `{OFF=0|ON=1}`** 
sets numeric mode

**vt100 numeric show** 
shows numeric mode state

**vt100 reset** 
resets terminal

**Notes**

1. Legacy - The command has been replaced by a newer version
2. Command can be entered on any level
3. The output may show 2 lines - the 1st line shows the actual state, the 2nd line the status after reboot
4. The output may show several lines
5. N/A
6. Please see the **External Type and External Sensor Field Tables** for the correct sensor index

4.9 Modbus TCP

**Important:** All calculations in this chapter are based on addresses starting at "0". For some Modbus TCP Utilities, however, the addresses start at 1, in which case a 1 must be added to the addresses in this chapter. Please try both possibilities for tests!

If Modbus TCP is activated in the configuration, the ports (relays, outputs, eFuses) can be switched and the following data is callable:

### Address range overview:

<table>
<thead>

<td>Holding Registers</td>
</tr>
</tbody>
</table>

**Important:** This chapter is general for all Gude devices. Depending on the device type, some ports or certain sensors are not available.

The Unit-ID is ignored because the device is uniquely identified by its IP address.

### Supported Modbus TCP Functions

External Sensors:

The measured value of the external sensors are coded as fixed point arithmetic. For a factor of e.g. 0.1 in the unit the value must be divided by 10 in order to reach the real measured value. A value of 0x8000 means that no sensor is plugged into the corresponding port, or the corresponding field in the sensor is not available. The formula for the address is (the port numbers start at zero):

0x100 + Port * 8 + Offset

In the Expert Sensor Box 7213 / 7214 the internal sensor corresponds to the value Port = 0, and is coded Port = 1 for Sensor 2 and Port = 2 for Sensor 3.

<td>Dew Point Difference</td>
<td>0.1 °C</td>
</tr>
</tbody>
</table>

For example, the humidity of the second port has the address: 0x100 + 1 * 8 + 1 = 0x109

Energy Sensors:

We distinguish the line sensors (which correspond to the input circuits) and the port sensors, which measure the energy that is passed over the switched port. The measured values of the energy sensors are returned as signed 32-bit integers. The high-order 16-bits are starting on the even address, followed by the low-order 16-bits on the odd address. To calculate the address, there are the following formulas (the values for line, port...
and phase start at zero):

Line: 0x0400 + Line * 0x120 + Phase * 0x60 + Offset * 2
Port: 0x3a00 + Port * 0x120 + Phase * 0x60 + Offset * 2

⚠️ For devices with only one phase, the phase is set to zero in the formula.

Examples:

*Power Active* for 1st line sensor and 3rd phase: 0x400 + 0 * 0x120 + 2 * 0x60 + 1 * 2 = 0x4c2

*Voltage* for 2nd line sensor and single phase device: 0x400 + 1 * 0x120 + 2 * 2 = 0x524

*Power Angle* for 4th port sensor and single phase device: 0x3a00 + 3 * 0x120 + 6 * 2 = 0x3d6c

<table>

</tr>
<tr>
<td>21</td>
<td>Residual Current Type A</td>
<td>mA</td>
</tr>
<tr>
<td>22</td>
<td>Neutral Current</td>
<td>mA</td>
</tr>
</tbody>
</table>

⚠️ Whether the measured values "Residual Current" and "Neutral Current" are supported depends on the respective device model. For measured values such as "Neutral Current", which are independent of the phase, the same value is returned for all phases.

**DC Energy Sensors:**

With the EPC 8291 / 8290 devices, the voltage and current of the individual banks and
Specifications

Voltage sources can be read out. The measured values of the energy sensors are returned as signed 16-bit integers. The following formulas are available for the address (the values for Bank and PowerSrc start at zero):

Bank: 0x8200 + Bank * 2 + Offset

Power Source: 0x8240 + PowerSrc * 2 + Offset

Examples:

"Voltage" at third bank: 0x8200 + 2 * 2 + 0 = 0x8204

"Current" at first PowerSrc: 0x8240 + 0 * 2 + 1 = 0x8241

</tbody>
</table>

Residual Current Monitor Type B (RCMB):

Devices with a Residual Current Monitor Type B (RCMB) module separately measure the RMS and DC fault current components of the input supply. The values are returned as signed 16-bit integers. The following formulas are used for the address (the module number starts at zero):

Bank: 0x8280 + ModuleNo * 8 + Offset.

Examples:

"Residual Current DC" at first module: 0x8280 + 0 * 8 + 1 = 0x8281.

"Output DC" for second module: 0x8280 + 1 * 8 + 3 = 0x828b

<table>

A value of 0x8000 means that no sensor is plugged into the corresponding port or the corresponding field in the sensor is not available.
Specifications

4.10 MQTT

This device supports MQTT 3.1.1 to send configured messages and also to receive commands. This chapter is general for all Gude devices, some Gude models do not have switchable ports.

- Default port for an unencrypted connection is port 1883.
- Default port for a TLS secured connection is port 8883.
- If the broker allows anonymous login, username and password are arbitrary, but a username must be specified.
- If multiple MQTT clients are connected to a broker, the names of the clients must be different. For this reason, "client_xxxx" is generated as the default name. Here "xxxx" are the last 4 digits of the MAC address.

Message format

The MQTT messages of the device are always sent in JSON format. E.G..

{"type": "portswitch", "idx": 2, "port": "2", "state": 1, "cause": {"id": 2, "txt": "http"}, "ts": 1632}

This is a switching of the second port to the state on. The source of the switching command is CGI ("http"). The index is always numeric, "port" can also be alphanumeric for devices with multiple banks, e.g. "A2". At the end follows a timestamp ("ts"), which indicates the number of seconds the device is on, or unixtime if the device has synchronized with an NTP server.

MQTT Topic Prefix

The topic prefix for the messages can be set in the MQTT configuration. A default would be e.g. "de/gudesystems/epc/[mac]". Here "[mac]" is a placeholder for the MAC address of the device, another possible placeholder is "[host]", which contains the host name. An example topic for a switching message of the second port would then be:

"de/gudesystems/epc/00:19:32:01:16:41/switch/2".

Executing console commands

The device can be controlled remotely via MQTT using console commands. A list of all commands can be found in the Console chapter. Depending on the topic, the commands are accepted in different formats.

⚠️ As default the execution of commands is not allowed, but must be enabled in the MQTT configuration! ("Permit CLI commands")

Format 1: Command in JSON Syntax

Publish Topic: "de/gudesystems/epc/00:19:32:01:16:41/cmd"
Publish Message: "{"type": "cli", "cmd": "port 2 state set 1", "id": 10}"

Response from device to "de/gudesystems/epc/00:19:32:01:16:41/cmdres"
"{"type": "cli", "cmdres": ["OK."], "result": {"num": 0, "hint": "ok"}, "id": 10}"
Specifications

The JSON object "result" returns whether the command was valid. The object "id" in the command is optional and is passed through in the response from the device. The passed number can help to establish a synchronicity between command and response via the broker.

Format 2: Raw Text

Publish Topic: "de/gudesystems/epc/00:19:32:01:16:41/cmd/cli"
Publish Message: "port 2 state set 1".

Response from device to "de/gudesystems/epc/00:19:32:01:16:41/cmdres/cli" "OK."

Format 3: Simplified port switching

Publish Topic: "de/gudesystems/epc/00:19:32:01:16:41/cmd/port/2"
Publish Message: "0" or "1".

Response from device to "de/gudesystems/epc/00:19:32:01:16:41/cmdres/port/2" "0" or "1"

This special form exists only for the port switching commands.

Device Data Summary

In the Device Data Summary the most important data of the device are summarized in a JSON object and sent periodically in a configurable time interval. This summary depends on the properties of the device and the connected sensors, and could look like this:

Topic: en/gudesystems/epc/00:19:32:01:16:41/device/telemetry

Message:

```javascript
{
  "type": "telemetry",
  "portstates": [{

### 4.10.1 Example HiveMQ

What does an MQTT configuration look like using HiveMQ as an example?

**Cluster Details**

Create a free or commercial account at www.hivemq.com and create a new cluster.

**Active MQTT Credentials**

These credentials give access to publish and subscribe to your HiveMQ Cloud cluster.

In the "Manage Clusters" section, go to "Access Management" and add an MQTT user with name and password.
In the MQTT configuration of the Gude device, transfer the hostname of the HiveMQ broker, as well as username and password. Additionally activate TLS and set the correct port.
Support
5 Support

You will find the latest product software on our website at www.gude.info available for download. If you have further questions about installation or operation of the unit, please contact our support team. Furthermore, we present in our support wiki at www.gude.info/wiki FAQs and configuration examples.

5.1 Data Security

To provide the device with a high level of data security, we recommend the following measures:

- Check that the HTTP password is switched on.
- Set up your own HTTP password.
- Allow access to HTTP via SSL (TLS) only.
- Use TLS 1.3 if possible and avoid TLS 1.1.
- Enable authentication and encryption in SNMPv3.
- Disable SNMP v2 access.
- Enable STARTTLS or SSL in the e-mail configuration.
- Archive configuration files securely, they contain sensitive information.
- In the IP ACL, enter only the devices that require access to HTTP or SNMP.
- Use SSH if possible, since Telnet is not encrypted.
- Set login for telnet or serial console.
- Use MQTT 3.1.1 only with TLS and password.
- Only permit MQTT CLI commands when the broker is trustworthy.
- Modbus TCP is not encrypted, only activate it in a secure environment.
- Activate "Message Authentication" in RADIUS.

When accessed from the Internet

- Use a randomized password with at least 32 characters.
- If possible, place the device behind a firewall.

5.3 Declaration of Conformity

This product from the Expert Net Control 2302 series is in conformity with the European directives for CE marking applicable to this product. The complete CE declaration of conformity for this product can be found on the website www.gude.info in the download section of the product.

5.4 FAQ

1. What can I do if the device is no longer accessible?

   - If the Status LED is red, the device has no connection to the switch. Unplug and plug the Ethernet cable. If the Status LED is still red, try other switches. If one uses no switch, but connects e.g. a laptop directly to the device, make sure you are using a crossover Ethernet cable.
   - If the status LED is orange for a longer time after unplugging and plugging the Ethernet cable, then DHCP is configured, but no DHCP server was found in the network. After a timeout, the last IP address is configured manually.
   - If there is a physical link (status LED is green) to the device, but you cannot access the web server, bring the device into bootloader mode and search for it with GBL_Conf.exe. Then check the TCP-IP parameters and change them if necessary.
   - If the device is not found by GBL_Conf.exe in bootloader mode, you can reset the settings to factory defaults as the last option.

Why is a device sporadically no longer accessible when DHCP is activated?

   - If DHCP is activated but no DHCP server can be reached, the last IP-address continues to be used. However, the DHCP client tries to reach a DHCP server again every 5 minutes. The DHCP request lasts one minute until it is aborted. During this time the IP-address is not accessible! It is therefore essential to deactivate DHCP for a static IP addresses!

3. What can be done if the device is no longer accessible, but the buttons still respond?

   - Entering or leaving the bootloader mode does not change the state of the relays. In the chapter Maintenance there is a description how to activate the bootloader by pressing the buttons and how to exit the bootloader afterwards. This will restart the firmware without switching relays. However, this procedure does not help if the network itself is incorrectly configured.

4. Where is the serial number stored in the device?
The serial number is not stored in the device, but only visible on the device label.
However, you can display the MAC address in the IP address configuration. If you
contact Gude Systems Support with the MAC address, we will be happy to give you the
 corresponding serial number.

5. Why does it sometimes take so long to configure new SNMPv3 passwords on
the website?

The authentication methods "SHA-384" and "SHA-512" are calculated purely in software,
and cannot use the crypto hardware. On the configuration page, e.g. "SHA-512", needs
up to 45 seconds to calculate the key.

6. Can you enter multiple e-mail recipients?

- Yes. In the E-Mail configuration in the Recipient Address field, it is possible to enter
  multiple e-mail addresses separated by commas. The input limit is 100 characters.

7. Why did the MIB tables change after the firmware update?

- Since the number of possible event types was increased, the previous trap design res-
 ulted in an excess of trap definitions: See Change in Trap Design.

8. Importing an older firmware

- During a firmware update, old data formats are sometimes converted to new struc-
tures. If an older firmware is newly installed, the configuration data and the energy
meters may be lost! If the device then does not run correctly, please restore the fact-
ory settings (e.g. from the Maintenance Page).

9. Disable switching events

- You can set the sending of syslog, emails etc. when switching ports (only concerns
  Gude devices with relays) under "System" in the sensor configuration.
